

Lesson Plan — Chapter 2 – Shaping of the Earth's Surface

Geography | Class 9 | Shaping of the Earth's Surface | Difficulty: intermediate

Total periods: 2

The two-period structure cleanly bifurcates the chapter's content into internal forces (Plate Tectonics) and external forces (Weathering and Erosion), ensuring adequate time for definitions, examples, and addressing common misconceptions without rushing.

Period 1: Internal Forces and Plate Tectonics (45 min)

Objectives

- Understand the theory of plate tectonics and how it shapes the Earth's surface.
- Define landform, lithosphere, and asthenosphere.
- Examine examples of plate boundaries such as fold mountains, mid-ocean ridges, and transform faults.

Concepts: Plate Tectonics

Focuses entirely on internal Earth dynamics, foundational structure (lithosphere/asthenosphere), and tectonic movements to build a solid base before moving to surface processes.

Period 2: External Forces: Weathering and Erosion (45 min)

Objectives

- Explain how weathering and erosion work together to break down and reshape the Earth's surface.
- Distinguish between weathering (in-place breakdown) and erosion (transportation of material) to address common misconceptions.

Concepts: Weathering, Erosion

Dedicates the second period to external surface-shaping processes, contrasting them directly against internal tectonic forces and correcting misconceptions regarding rock movement.
